

REMAN DIESEL PARTICULATE FILTERS (DPFs)

For various Valtra applications

We are pleased to announce the launch of our remanufactured range of Diesel Particulate Filters (DPFs) for various Valtra applications. AGCO DPF cleaning uses a proprietary process of sealing the filter, adding deionized water, combined with pulses of compressed air to eject soot and ash deposits at high velocity from the filter, then oven drying to remove all moisture. This process restores DPFs to 95% of their original function.

Why us?

- Our unique selling point is the inspection technology. We use visual and infrared light tests to inspect the inside of the filter, and an airflow test to ensure the filter is properly cleaned and undamaged.
- No competitor on the market can provide such valuable inspection. Our inspection technology means no dirty or damaged DPF is replaced on an engine.
- Superior performance over conventional cleaning processes – removes up to 30% more contaminants.
- We use highly efficient, automated, patented technologies.
- Improved fuel consumption and vehicle performance.
- Less filter failures and expensive replacements.
- Data capture of filter condition to record details over filter lifetime.
- Ensures compliance with Stage V emissions legislation.
- Protect upstream failures in the after treatment system and engine.
- All AGCO reman parts are tested to meet the OE standards so you get the **same quality, specification, performance and warranty as new at a cheaper price.**
